Can I Use Your Services To Perform DDoS Attacks?

Table Of Contents

Do you want to get the authorities to knock on your door? Do you think that would be faster than calling 911 (or the similar emergency number in your country)?

If your service is found to be used to perform DDoS attacks with or without your knowledge, we reserve the right to suspend it permanently or temporarily - depending on the situation and common sense.

1 How will you know?

We value your privacy and therefore don't monitor or control what goes through the network connection of your service. Usually, the person, organization or company you are performing DDoS attacks will send a complaint with an attached report which we will be able to verify and confirm on our side. Alternatively, we may also notice what you are doing in case you disrupt our network.

2 Can you check what happened?

In case your service is used to perform DDoS attacks, we may have to create a backup for auditing purposes. This backup may be kept up to 5 years. We might ask for your authorization and help to review the backup if the DDoS attacks were performed without your knowledge. In case you have sensitive data on your service or your data is encrypted, we can schedule a remote session through TeamViewer or similar services to retrieve the necessary logs.

3 Will you report to the authorities?

It will depend on the situation. We might have to report and collaborate with the authorities even if the DDoS attacks were performed by a third party accessing your server without authorization.

4 If you suspend my service permanently what will happen to my data?

If it depends on us, you will never lose any of your data in any case. We will contact to help you retrieve your data.
